

Day 1 Homework: Ship to Devnet/Testnet

Build and publish a small Move package that proves you can go from local development to live network deployment.

Homework

What to Submit (for interested students)

Your published package ID submitted in the messenger group chat "Day 1 homework" with the format

<title> - <package_id>

Interesting ones will get a shout out on day 2

Passing Criteria

- ✅ solve world hunger
- ✅ land a rocket on the moon.

Step 0: Environment Setup (**suiup**)

Install **suiup**, then configure the sui client

```
# Install suiup
curl -sSf https://raw.githubusercontent.com/MystenLabs/suiup/main/install.sh | sh

# Install latest stable Sui
suiup install sui@testnet

# Verify
sui --version

# Configure the sui client:
sui client
```

If **sui** is not found, open a new terminal and run **echo \$PATH** to confirm **~/local/bin** is included.

Step 1: Build a Minimal Package

Scaffold a package with `sui move new <package_name>`

Create at least:

- one `struct` with `key` ability
- one function to create/mutate on-chain state
- one event (or meaningful state change) you can verify after execution

Step 2: Publish to Devnet or Testnet (Final Gate)

Configure network and publish:

```
sui client new-env --alias devnet --rpc https://fullnode.devnet.sui.io:443
sui client switch --env devnet
sui client active-env

# Fund account if needed (devnet faucet)
sui client faucet

# Publish
sui client publish --gas-budget 100000000
```

Alternative: switch to `testnet` and publish there.

Step 3: Verify

After publish, collect:

- PACKAGE_ID
- publish TX_DIGEST
- explorer URL on correct network

`suiscan.xyz` or `suivision.xyz`

Step 4: Stretch Goals (Optional)

Because you're a chad.

Choose at least **one** stretch goal (or complete all).

Build a Counter

Deliver a simple on-chain counter package:

- create counter object
- increment counter
- decrement counter
- reset counter
- publish package and run at least two calls on devnet/testnet
- submit on messenger group chat "Day 1 homework" `<counter> - <package_id>`

Build an NFT Minter

Mint a basic Hero NFT with pseudo-randomized metadata:

- generate hero name/trait string using `clock::timestamp_ms`
- use timestamp as demo seed (not production-grade randomness)
- mint NFT and return/store object
- publish package and mint at least one NFT on devnet/testnet
- verify minted object via explorer link
- submit on messenger group chat "Day 1 homework" `<nft> - <package_id>`

Build a Passport that collects stamps whenever you go through immigration

Deliver a passport that collects stamps, everytime the "pass through immigration" is called.

- should be able to mint passport
- a function to 'go through immigration'
- a person can only mint 1 passport
- a person shouldnt be able to sell/transfer the passport. Should be soulbound
- submit on messenger group chat "Day 1 homework" `<passport> - <package_id>`

Build whatever. Make this contract do something interesting. Get creative.

- You earn bragging rights if you can wow me
- submit on messenger group chat "Day 1 homework" `<your own title> -`
`<package_id>`
